## Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

FUNCTION: Receptor for the lysosphingolipid sphingosine 1-bhosphate (SIP). SIP is a bloative lysophospholipid that elicits diverse physical opical effect on most types of cells and tissues. When expressed in rat HTC4 hepatoma cells, is capable of mediating SIP-induced cell proliferation and suppression of apoptosis. SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: Belongs to the G-protein coupled receptor 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MGSLYSEYLNPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           phosphate (SIP). SIP is a bioactive lysophospholipid that elicits phosphate (SIP). SIP is a bioactive lysophospholipid that elicits adverse physicological effect on most types of cells and tissues.
-!-SUBCELULAR LOCATION: Integral membrane protein.
-!-TISSUE SPECIFICITY: Most abundant in heart and lung; low, but clearly observed in kidney, liver and thymus; much lower but detectable in brain, testis, stomach and intestine. Not significantly detected in any of the sections of embryonic day (E118, except in embryonic brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE=99132320; PubMed=9931453; DOI=10.1016/S0378-1119(98)00589-7; Zhang G., Contos J.J.A., Weiner J.A., Fukushima N., Chun J.; "Comparative analysis of three murine G-protein coupled receptors activated by spiningosine-1-phosphate.";

                                                            MEDLINE=95047498; PubMed=7959012; DOI=10.1016/0378-1119(94)90171-6; A. Lado D.C., Browe C.S., Gaskin A.A., Borden J.M., Maclennan A.J.; Lado D.C., Browe C.S., Gaskin A.A., Borden J.M., Maclennan A.J.; "Cloning of the rat edg-1 immediate-early gene: expression pattern "cloning of the rat edg-1 immediate-early gene: expression pattern graphs of the rat edg-1 immediate early gene: expression pattern angiores diverse functions."; Gene 149:331-336(1994).

I. Gene 149:331-336(1994).

I. FUNCTION: Receptor for the lysosphingolipid sphingosine 1-phosphate (SIP). SIP is a bloactive lysophospholipid that elicits diverse physiological effect on most types of cells and tissues. This inducible epithalial cell G-protein-coupled receptor may be involved in the processes that regulate the differentiation of heteromeric G proteins (BP similarity).

I. SUBCELUULAR LOCATION: Integral membrane protein.

I. DEVELOPMENTAL STAGE: First detected at embryonic day 15. At postnatal day 14 detected in skin, spleen, liver, kidney, heart, testicle, lung and brain. At adulthood is most abundant in brain.

I. SIMILARITY: Belongs to the G-protein coupled receptor 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phosphoserine (Potential).
S-palmitcyl cysteine (By similarity).
N-linked (GlcNAc. . .) (Potential).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A novel isolated lysolipid (LL) receptor/EDG receptor (EDG-4). The LL/EDG receptors are involved in an inflammatory response signaling pathway and an apoptotic signaling pathway. They can be used for identifying agonists or antagonists of NF-kB or IL-8 modulated EDG or LL receptors. Agonists can be used for upregulation of an inflammatory process condition or immune response. Antagonists can be used for the downregulation of an

antagonists can also be used for controlling apoptosis in a cell
comprising the LL/EDG receptor. A diagnostic test for aberrant expression
of HEBG-4 can accelerate diagnosts and proper treatment of abnormal
conditions of e.g. the heart, kidney, lung and testis. Specific examples
of conditions in which aberrant expression of HEBG-4 may play a role
include adult respiratory distress, asthma, rheumatoid arthritis, stroke,
conditions in which aberrant expression of HEBG-4 may play a role
include adult respiratory distress, asthma, rheumatoid arthritis, stroke,
concurranma, Alzheimer's disease, endotoxic shock, psoriasis,
cardiac ischemia, acute pancreatitis, septic shock, psoriasis of the
cyclosporine nephrotoxicity, HIV/AIDS, myelodysplasia, cirrhosis of the
cliver, and early diabetic glomerulopathy, as well as lung damage
collowing exposure to cigarette smoke, abestos or silica. HEDG-4
specific antibodies, inhibitors, ligands or their analogs can be used as
bloactive agents to treat inflammation or disease including viral,
bacterial or fungal infections, allergic responses, mechanical injury
associated with trauma, hereditary diseases, lymphoma or carcinoma, or
cother conditions which activate the genes of kidney, lung, heart,
cyclymphoid or tissues of the nervous system The agonists and inflammatory process condition or immune response. 8888888888888888888888

is used for diagnosing disease or its susceptibility in a subject related with expression or activity of H218 by determining the presence or absence of mutation in the polymuclectide encoding H218 in the genome of the subject and/or analysing for the presence of 4218 expression in sample derived from the subject. It is also used for treating subjects in need of enhanced activity or inhibition of H218 by administering an agonist or antagonist respectively. H218 can be used to treat abnormal conditions such as bacterial, fungal and viral infections, particularly H1V-1 or 2, cancers, diabetes, beeity, anoraxia, bullimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, urinary retention, osteoporosis, angina pectoris, myocardial infarction, erroke, ulcers asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic, neurological disorders and dyskinesias can be treated. The H218 polymucleotide can also used for obtaining control of migration probes and primers for isolating full-length clones encoding H218. The difference in cDNA or genomic sequence between affected and unaffected individuals is determined to identify mutation causing the disease. It is also valuable for chromosome identify mutation causing the disease. It is also valuable for chromosome identify mutation control receptors through standard receptor binding techniques and also control or exceptors through standard receptor binding techniques and also present sequence is a human EDG family protein designated H218.    A novel isolated lysolipid (LL) receptor/EDG receptor (EDG-4). The LL/EDG receptors are involved in an inflammatory response signaling pathway and an apoptotic signaling pathway. They can be used for identifying agonists or antagonists of NR-kB or IL-8 modulated EDG or LL receptors. Agonists or antagonists of NR-kB or IL-8 modulated EDG or LL receptors. Agonists or immune response. The agonists and inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and engine and proper treatment expression of the EDG-4 can accelerate diagnosis and proper treatment of abnormal conditions of e.g. the heart, Kidney, lung and testis. Specific examples of conditions in which aberrant expression of HEDG-4 may play a role include adult respiratory distress, asthma. Theumatorid arthritis, stroke, neurotrauma, Alzheimer's disease, andotoxic shock, atherosclerosis, cardiac ischemia, acute pancreatiis, septic shock, psoriasis, acute cyclosporine nephrotoxicity, HIV/AIDS, myelodysplasia, cirrhosis of the liver, and early diabetic glomerulopathy, as well as lung damage cyclosporine nephrotoxicity, HIV/AIDS, myelodysplasia, cirrhosis of the cyclosporine agents to treat inflammation or disease including viral, bacterial or fungal infections, allergic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or carcinoma, or other conditions which activate the genes of kidney, lung, heart, lymphoid or tissues of the nervous system

The present sequence represents an Edg polypeptide. The specification describes Edg4 and Edg5 polypeptides. The Edg4 gene is located on chromosome 19pl2. The Edg polypeptides are receptors for 1ycophospholipids and sphingolipids, such as lysophosphatidic acid (LPA) and sphingosine 1-phosphate (SIP). The Edg receptor proteins are used for diagnosing an LPA or SIP mediator condition an individual. Edg4 and Edg5 polypeptides can be used in screening assays designed to determine the Effects of a candidate bioactive agent on the expression and activity of Edg4 and Edg5 polypeptides, and the function of LPA and SIP. Nucleotide sequences encoding Edg-4 and Edg-5 are useful a hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. Nucleic acids which encode Edg4 or Edg5 or their modified forms can also be used to generate either transgenic animals or knock out animals.

The invention relates to a novel method for gene expression analysis by collective quantitative analysis of the expression of a number of genes to identify those that are promoted or inhibited in a given cell or tissue. The genes are preferably gene families such as the G protein gene family. The methods may be used in treatment of cancers, including prostate, ovarian, stomach, bladder, breast, and cancer of the intestines. EDG-1 and EDG-2 receptor agonists and antagonists may be used in the treatment and prevention of atheroscelerosis, myocardial infarction, infarct or ischaemic disease of the brain. This sequence represents a protein of human EDG-5 of the invention.

The present invention describes a method for identifying an increase in risk for Type II diabetees mellitus and/or venous thrombosis/pulmonary embolism, comprising determining the presence of amino acid exchange at position 266 from Val to Ala in the EDG5 protein. Also described: (1) a preventing type II diabetes and/or venous thrombosis/pulmonary embolism, where a cell or cell extract is used that contains EDG5 with the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA; (2) a method for adapting the dosage of the pharmacceutical described above by testing the human cell for the presence of EDG5 protein or the EDG5-286-AA; (2) a method of selecting parients who will respond type II diabetes and/or venous thrombosis/pulmonary embolism by testing the probe of the respective

patient for the presence of EDG5 with the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA; and (4) a test kit for testing the presence of the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA. EDG5 has antidiabetic and thrombolytic activities, and can be used in gene therapy. The methods are useful for identifying an increase in risk for type II diabetes mellitus and/or thrombosis/pulmonary embolism, and for screening pharmaceuticals useful for treating type II diabetes mellitus and/or venous thrombosis/pulmonary embolism. The methods are also useful for adapting the dosage of a pharmaceutical useful for treating the above diseases. The methods are useful for sequence represents who will respond to the pharmaceutical. The present sequence represent invention.

This invention relates to a novel method for identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or a combination thereof. Specifically, it refers to a the endothelial differentiation gene 5 (EDG5) located on chromosome 19913.2, which encodes a G protein coupled receptor protein. The present invention describes an immunochemically reactive labelled antibody based kit that can be used to identify the Val286Ala variation in the EDG5 protein encoded by a single nucleotide polymorphism. Furthermore, this allele encoding the V286A variant represents a genetic marker that can be useful for preventative treatments of the aforementioned diseases, as well as for adapting drug dosage for patients, for drug screening purposes or for patient selection in phase or clinical studies. This polypeptide sequence is the human EDG5 protein of the invention.
  Identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or its combination in subject by determining whether amino acid residue at position 286 of BDG5 protein is

  The invention relates to an isolated nucleic acid encoding a mammalian Edg7 receptor. The mammalian Edg7 receptor proteins and nucleic acid encoding the proteins are useful for diagnosing and treating an abnormality associated with the activity of the mammalian Edg7 receptors, cdiabetes, respiratory disorder, asthma, immune disorder, hypertension, disorder, memory disorder, obssity, pain, psychotic behaviour, affective disorder, migraine, cancer, AIDS, wound healing, or ischaemia-reperfusion injury-related diseases. The nucleic acids and proteins are also useful for developing and designing drugs with higher specificity and fewer side effects. The nucleic acid such an attisense oligonucleotides concoling mammalian Edg7 receptors and antisense oligonucleotides complementary to the nucleic acid sequences. The methods are also useful for identifying agonists and antisense oligonuclectics. The present so requence represents the amino acid sequence of the human Edg5 receptor.

compounds useful in the treatment of GPCR-related diseases; cells derived
from the trassgenic mice; kits comprising several mice, each of which has
comprising a GPCR transgene or in an endogenous GPCR gene; cells derived
comprising a GPCR nucleic acid. The GPCR mucleic acids and proteins may
be used in the diagnosis, treatment or prevention of a wide variety of
invention further discloses variants of the GPCR polypeptides and vectors
comprising a GPCR nucleic acid. The GPCR mucleic acids and proteins may
be used in the diagnosis, treatment or prevention of a wide variety of
depression, diabetic neuropathy, Parkinson's disease or schizophrenia's
disorders of the adrenal gland; disorders (e.g., Alzheimer's disease,
disorders of the adrenal gland; disorders (e.g., angina, cardiac arrhythmia or
myccardial infarction); muscular disorders (e.g., autoimmune disorders of e.g.,
anaemia or leukaemia); immune disorders (e.g., autoimmune disorders of
competity, enzyme deficiency-related diseases or vitamin disorders or
diseases); and disorders (e.g., on turtitie, due content,
prostate, testis, skin, stomech, pancreas, spleen, thymus and
thyroid (e.g., cancers). The present sequence represents a GPCR of the
invention. Note: The full sequence data for this patent did not form part
contens, prostate, testis, skin, secondaria sequences.

comprises capanosing arseases such as a caraturbascular diseases, diseases in a mammal. The invention also comprises a pharmaceutical diseases in a mammal. The invention also comprises a pharmaceutical composition for the treatment of the diseases above comprising an EDG5 polyapeptide or which regulates the EDG5 polypeptide activity composition for the treatment of the diseases above comprising an EDG5 polyapeptide or which regulates the EDG5 polypeptide activity such as a small molecule, an RNA molecule, an antisense oligonuclectide, a polypeptide, an antibody, or a ribozyme; and preparation of a polypeptide, an antibody, or a ribozyme; and preparation of a polypeptide, an antibody, or a ribozyme; and preparation of a trianteriosclerotic, antisthmatic, antiarteriosclerotic, antisthmatic, antiarteriosclerotic, antisthmatic, antiarteriosclerotic, antisthmatic, antiarteriosclerotic, antiparkinsonian, antiulocer, cardiant, cerebroprotective, dermatological, gynecological, neuroprotective, cerebroprotective, dermatological, gynecological, neuroprotective, cerebroprotective, dermatological, gynecological, neuroprotective, cerebroprotective, dermatological, gynecological, neuroprotective, cerebroprotective, diseases, disorders of the gastroenterology system, cerebroprotective diseases, disorders of the gastroenterology system, cerebroprotective, diseases in a mammal. They are also useful for the regulation of EDG5 activity in a mammal having the disease.

Cardiovascular disease includes heart failure, myocardial infarction, ischaemia, arrhythmias, and atherosclerosis. Examples of disorders of the peripheral and central nervous gastrictis, gastric ulcers, and chronic pancreatitis. Examples of disorders of the peripheral and central or erproduction disorders are syphilis, genital warts, impotence, vaginitis, dermenta, and infartility. Disorders of the peripheral and central or erproduction disorders and infartalismor's diseases comples compensation or erproduction disorders and infartalismory diseases compensation or e

agents. The method comprises contacting a test compound with an endotherlial differentiation sphingolipid G-protein-coupled receptor 5 (EDGS) polypeptide or polymucleotide and detecting binding of the test compound, or determining EDGS polypeptide activity at a certain test compound concentration or in the absence of the test compound and at a different concentration of the test compound. The invention further comprises: diagnosing diseases such as a cardiovascular diseases,

The invention relates to a novel method for screening for therapeutic

chronic obstructive pulmonary disease. The nucleotide sequences encoding EDG5 are useful as hybridization probes, in constructing oligomers for PCR, for chromosome and gene mapping, in the recombinant production of EDG5, in generating antisense DNA or RNA and in molecular biology techniques that have not yet been developed. EDG5 polypeptides are useful for immunising a mammal to produce polyclonal antibodies and for diagnostic purposes. This sequence represents the human EDG5 receptor protein of the invention.
